Maryan Abdi

Problem

The starting Tetris code is buggy and missing features

No user wants to play a version of Tetris filled with holes.

User

People who play retro video games

Our target audience is people who play retro video games, so we should keep the game as true to the original as possible while adding a couple features.

Daniel

Challenge System

Daniel will handle the features relating to increasing the challenge for Tetris masters. This includes scoring, difficulty levels, and increasing fall speed.

Eurydice

Pieces/Movement

Eurydice will handle functions associated with pieces like hard drop, hold piece, and a piece preview element.

Maryan

UI/UX

Maryan will handle user experience elements like themes, pausing, and a start menu to ensure that good mechanics are backed up by a good interface.

Event-Driven

The current architecture we have planned is event driven, meaning that all Tetris functions will be placed in classes and functions to be called upon when “events”, like user input, happen.

Communicate frequently and respectfully

The main rules for our team are to communicate frequently and respectfully.

We plan to meet every Thursday to do a check-in and progress update.

We plan to refactor and get a rough draft done by the end of Sprint One.

Sprint two will be spend cleaning existing code and adding a few more features for a polished MVP.
